# Your Turn 1

How has life expectancy changed over time?

Make a line plot of **lifeExp** vs. **year** grouped by **country**. Set alpha to 0.2 to see the results better.

02 : 00

```
gapminder %>%
```

```
  ggplot(mapping = aes(x = year, y = lifeExp, group = country)) +  
    geom_line(alpha = 0.2)
```

# Idea 1

To quantify "linearity," fit a linear model, compare **r-squared**.

# Idea 2

To quantify rate of change, fit a linear model, extract **coefficient on year**.

# Goal

Fit model, compute  $R^2$ , collect coefficient ***for every country***.

1. **dplyr** + **tidyr** grouping toolkit
2. **purrr** toolkit and list columns

# List Columns

# Quiz

- How is a data frame/tibble to a list?

# A data frame / tibble is a list

data frame

num	cha	log
1	"one"	TRUE
2	"two"	FALSE
3	"three"	FALSE

=

list

1	2	3	double
"one"	"two"	"three"	character
TRUE	FALSE	FALSE	logical

+ class = "data.frame"

# A data frame / tibble is a list

data frame

num	cha	log
1	"one"	TRUE
2	"two"	FALSE
3	"three"	FALSE

df["num"]

num
1
2
3

df[["num"]]

df\$num

c(1, 2, 3)

# A data frame / tibble is a list

data frame

num	cha	log
1	"one"	TRUE
2	"two"	FALSE
3	"three"	FALSE

`df %>% select(num)`

num
1
2
3

`df[["num"]]`

`df$num`

`c(1, 2, 3)`

# Quiz

If one of the elements of a list can be another list, can one of the columns of a data frame be another list?

List

1	2	3	double
"one"	"two"	"three"	character
list			
1	double		
"1"	"two"	"FALSE"	character
FALSE	logical		

?

=

data frame

num	cha	listcol
1	"one"	1
2	"two"	c("1", "two", "FALSE")
3	"three"	FALSE

# Yes

```

## Organization.

We keep think that are related together.

**Nesting**

# nest()

Nest rows into a list column by group.

```
nest(.data, ...)
```

A grouped  
data frame

Places grouped cases into a list column.

```
gapminder %>%  
  group_by(country) %>%  
  nest()
```

# Your Turn 2

Run the chunk, then filter **gapminder\_nested** to find the countries with **r.squared** less than 0.5.

02 : 00

```
gapminder_nested %>%
  filter(r.squared < 0.5)
```

```
# A tibble: 13 x 4
```

	country <fct>	data <list<df[,5]>>	model <list>	
1	Botswana	[12 x 5]	<S3: lm>	
2	Central African Republic	[12 x 5]	<S3: lm>	0.493
3	Congo, Dem. Rep.	[12 x 5]	<S3: lm>	0.348
4	Cote d'Ivoire	[12 x 5]	<S3: lm>	0.283
5	Kenya	[12 x 5]	<S3: lm>	0.443
6	Lesotho	[12 x 5]	<S3: lm>	0.0849
7	Namibia	[12 x 5]	<S3: lm>	0.437
8	Rwanda	[12 x 5]	<S3: lm>	0.0172
9	South Africa	[12 x 5]	<S3: lm>	0.312
10	Swaziland	[12 x 5]	<S3: lm>	0.0682
11	Uganda	[12 x 5]	<S3: lm>	0.342
12	Zambia	[12 x 5]	<S3: lm>	0.0598
13	Zimbabwe	[12 x 5]	<S3: lm>	0.0562

But how can we plot these countries?

# unnest()

Flatten list columns into regular columns

```
unnest(data, cols, ...)
```

Nested data  
frame

Columns to  
unnest

```
poor_fit <- gapminder_nested %>%  
  filter(r.squared < 0.5)  
  
poor_fit %>% unnest(data)
```

Columns from  
inside **data**

Previous123456...16Next

```
unnest(poor_fit, data) %>%  
  ggplot(aes(x = year, y = lifeExp)) +  
    geom_line(aes(color = country))
```

# Your Turn 3

**Edit** the code in the chunk provided to instead find and plot countries with a slope above 0.6 years/year.

I've provided a **get\_slope()** function:

```
get_slope <- function(mod) {  
  tidy(mod) %>% filter(term == "year") %>% pull(estimate)  
}
```

06 : 00

```
gapminder_nested <- gapminder_nested %>%  
  mutate(slope = map_dbl(model, get_slope))  
  
big_slope <- gapminder_nested %>%  
  filter(slope > 0.6)  
  
unnest(big_slope, data) %>%  
  ggplot(aes(x = year, y = lifeExp)) +  
    geom_line(aes(color = country))
```

# Recap

A table is...an organizational structure...that you can manipulate.

# Benefits

Data and models stay in correspondence across manipulations

```
gapminder_nested %>% filter(str_sub(country, 1, 1) == "P")
```

country <fctr>	data <S3: vctrs_list_of>	model <list>	r.squared <dbl>	slope <dbl>
Pakistan	<S3: vctrs_list_of>	<S3: lm>	0.9972497	0.4057923
Panama	<S3: vctrs_list_of>	<S3: lm>	0.9511952	0.3542091
Paraguay	<S3: vctrs_list_of>	<S3: lm>	0.9829865	0.1573545
Peru	<S3: vctrs_list_of>	<S3: lm>	0.9884740	0.5276979
Philippines	<S3: vctrs_list_of>	<S3: lm>	0.9914226	0.4204692
Poland	<S3: vctrs_list_of>	<S3: lm>	0.8396631	0.1962189
Portugal	<S3: vctrs_list_of>	<S3: lm>	0.9690351	0.3372014
Puerto Rico	<S3: vctrs_list_of>	<S3: lm>	0.9078191	0.2105748

8 rows

# Your Turn 4

## Challenge:

1. Create your own copy of **gapminder\_nested** and then add one more list column: **output** which contains the output of **augment()** for each model.
2. Plot the residuals against time for the countries with small r-squared.

06 : 00

```
jake_gapminder <- gapminder_nested

jake_gapminder %>%
  mutate(output = map(model, augment)) %>%
  filter(r.squared < 0.5) %>%
  unnest(output) %>%
  ggplot(aes(x = year, y = .resid)) +
    geom_line(aes(color = country))
```

# Bootstrapped Comparisons

1. Write a function to calculate the comparison of interest on your observed data
2. Create bootstrapped samples
3. Apply the function to each sample
4. Create a distribution of comparison value from each bootstrapped sample

1. Write a function to calculate the comparison of interest on your observed data

```
mean(admission$gre_v[admission$gender == "Male"]) -  
  mean(admission$gre_v[admission$gender == "Female"])  
[1] 0.02895073
```

```
mean_diff <- function(splits) {  
  x <- analysis(splits)  
  mean(x$gre_v[x$gender == "Male"]) -  
    mean(x$gre_v[x$gender == "Female"])  
}
```

## 2. Create bootstrapped samples

```
admission %>%  
  bootstraps(times = 100)  
# Bootstrap sampling  
# A tibble: 100 x 2  
  splits          id  
  <list>        <chr>  
1 <split [9.4K/3.5K]> Bootstrap001  
2 <split [9.4K/3.4K]> Bootstrap002  
3 <split [9.4K/3.5K]> Bootstrap003  
4 <split [9.4K/3.5K]> Bootstrap004  
# ... with 96 more rows
```

### 3. Apply the function to each sample

```
admission %>%  
  bootstraps(times = 100) %>%  
  mutate(grev_diff = map_dbl(splits, mean_diff))  
# A tibble: 100 x 3  
  splits          id      grev_diff  
* <list>         <chr>      <dbl>  
1 <split [9.4K/3.5K]> Bootstrap001  0.0728  
2 <split [9.4K/3.4K]> Bootstrap002 -0.0990  
3 <split [9.4K/3.5K]> Bootstrap003 -0.190  
4 <split [9.4K/3.5K]> Bootstrap004  0.0751  
# ... with 96 more rows
```

4. Create a distribution of comparison value from each bootstrapped sample

```
set.seed(32011)
grev_gender <- admission %>%
  bootstraps(times = 100) %>%
  mutate(grev_diff = map_dbl(splits, mean_diff))

ggplot(grev_gender, mapping = aes(x = grev_diff)) +
  geom_density()
```

```
quantile(grev_gender$grev_diff, probs = c(0.025, 0.500, 0.975))
```

# Your Turn 5

Is there a difference between the percentage of male and female applicants admitted?

- Modify the function to calculate the difference between the percentage of males admitted and the percentage of females admitted
- Apply the function to 100 bootstrap samples
- Create a density plot of the results

05 : 00

1. Write a function to calculate the comparison of interest on your observed data

```
mean(admission$admit[admission$gender == "Male"]) -  
  mean(admission$admit[admission$gender == "Female"])  
[1] 0.09410073
```

```
pct_diff <- function(splits) {  
  x <- analysis(splits)  
  mean(x$admit[x$gender == "Male"]) -  
    mean(x$admit[x$gender == "Female"])  
}
```

## 2. Apply the function to each sample

```
admission %>%  
  bootstraps(times = 100) %>%  
  mutate(admit_diff = map_dbl(splits, pct_diff))  
# A tibble: 100 x 3  
  splits          id      admit_diff  
* <list>         <chr>      <dbl>  
1 <split [9.4K/3.5K]> Bootstrap001  0.0923  
2 <split [9.4K/3.5K]> Bootstrap002  0.0879  
3 <split [9.4K/3.4K]> Bootstrap003  0.0964  
4 <split [9.4K/3.5K]> Bootstrap004  0.0991  
# ... with 96 more rows
```

3. Create a distribution of comparison value from each bootstrapped sample

```
set.seed(32011)
admit_gender <- admission %>%
  bootstraps(times = 100) %>%
  mutate(admit_diff = map_dbl(splits, pct_diff))

ggplot(admit_gender, mapping = aes(x = admit_diff)) +
  geom_density()
```

```
quantile(admit_gender$admit_diff, probs = c(0.025, 0.500, 0.975))
```

# Consider

How would you assess model performance?

More to come in Case Study 3....

# Recap

- Store objects and other lists in list-columns of data frames
- Use **bootstraps()** to recreate resampled data objects
- Use **vfold\_cv()** to create *analysis* and *assessment* sub-samples of your data to assessment model performance
- Use **purrr** to iterate over bootstrapped samples and cross validation folds

# Organize Multiple Models
